Pre-Read

Backend System: Student in a range.

Problem Statement -

Relevel is expanding globally. So, they have to travel worldwide a lot to open new offices where the students and teacher can interact in real-time, which will benefit both. The only remaining issue is "Where should they buy the new offices '?

Albert Einstein suggested creating an app that can show the population density of students in a particular area. If it is high, Relevel will buy offices in that area.

Follow the standard naming conventions and comment on the code well to easily understand. We are looking for a basic working prototype, so make your assumptions accordingly and pace yourself.
